

# STANDARD MODEL -beyond and aside-

*Djordje Šijački*

# ...beyond...

Rank	Typical Subalgebras of $E_6$
6	$E_6$ 
5	$SO(10)$  $SU(4) \times SU(2)_L \times SU(2)_R$ 
4	$SU(5)$  $SU(3)_C \times SU(2)_L \times SU(2)_R$ 
3	$SU(3)_C \times SU(2)_L \times U(1)_Y$ 

Dynkin diagrams are a graphic way to summarize the roots of a Lie algebra. This figure shows

- g-2
- Fermilab, Chicago, USA
- 150 people from 40 institutions in 7 countries
- Studies spinning muons
- LHCb
- CERN, Switzerland/France
- 1260 people from 74 scientific institutes in 16 countries
- Has seen a deficiency of muons

# IS THE END IN SIGHT FOR THEORETICAL PHYSICS?

**S W Hawking**

In this article I want to discuss the possibility that the goal of theoretical physics might be achieved in the not too distant future, say, by the end of the century. By this I mean that we might have a complete, consistent and unified theory of the physical interactions which would describe all possible observations. Although we have

values of the parameters arbitrary but that they are picked out very carefully. For example, if the proton-to-electron mass difference were not 1836, but 1837, the universe would be a different place. The constants of nature are a couple of hundred or so. They are the basis of chemistry and

given kind from being in any matter particles are divided into groups, the hadrons, which are composed of quarks, and the leptons, which are the remainder.

The interactions are divided phenomenologically into four categories. In order of strength they are: the strong forces which interact only
